## Joe Kane Samsung Projector

- Gamma set to be similar to CRT projector - comes out of black slowly
- No enhancement in its video path
- No frequency roll-off like in LCOS, SXRD or LCD projectors
- Superior lens gives excellent corner & center focus, Modulation Transfer Function, and lack of chromatic aberration
- Longer optical path for superior flat field uniformity
- "Carbon Arc" mode emulates original B&W projection
- More accurate grey scale because it is calculated, not manually set like other projectors
- All video inputs recognize HD scan rates vs. SD scan rates and choose the correct decoder for each
- Displays 24p properly by doubling it to 48, essentially doing the same thing a film projector does with 24 frame content
- The only Hollywood mastering reference projector
- Very limited distribution
